ABSTRACT

Clustering is a discipline devoted to find and describe cohesive or homogeneous chunks in data, the clusters. An example of clustering problem is the automatic revealing of meaningful parts in a digitalized image. The motivation for the focus on data clustering is the fact that data clustering is an important process in pattern recognition and machine learning. Clustering algorithms are used in many applications such as image segmentation, vector and color image quantization, compression, etc. Therefore, finding an efficient clustering algorithm is very important for researchers in many different disciplines.

The primary objective of this thesis is to utilize Genetic Algorithm (GA) as a clustering tool for the unsupervised classification of grayscale image data. It presents two variants of GA: the first variant is based on the canonical GA while the second variant is based on compact GA, cGA. The characteristics components of each algorithm are presented in term of individual and population representation, fitness function evaluation, evolution (selection, crossover, and update) operators, and stopping condition. These two genetic algorithms are then coupled with one popular local-search cluster algorithm, known as K-means algorithm. By coupling, the objective is to harness the power of each algorithm: GA search exploration power and K-means search exploitation power. Moreover, the canonical mechanism of perturbation operators symbolized by both crossover and mutation is imitated in a modified version of cGA in an attempt to improve its search power.

To show the applicability of the presented clustering algorithms, Human medical MRI and land sat images, are used in the experiments. Also, the experiments considered different number of clusters. Comparison results are reported in qualitative terms (i.e. visually) and in quantitative terms using quantization error, weighted error (sum of cluster compactness, clusters separation, and quantization error), and compactness-separation ratio. Results demonstrate that cross-fertilization between the two algorithms is of being benefit in image data clustering, and it outperforms K-means and genetic-based algorithms when they operated individually. Additionally and more interestingly, the modified cGA outperforms the traditional cGA, which leverage the influence of the added perturbation operators including two-point crossover and binary mutation.

Acknowledgments

I would like to express my sincere appreciation to my supervisors, Dr. Bara'a Ali and Dr. Sawsan Kamal, for giving me the major steps to go on to explore the subject, sharing with me the ideas in my research "Clustering Approach for Unsupervised Image Classification using Genetic Algorithm" and discuss the points that I felt they are important.

Grateful thanks for the Head of Department of Computer Science, **Dr. Taha S. Bashaga**,

Also, I would like to say "thank you" to my Parents and my Husband for their supporting and encouragement and I want to thank my faithful friends for supporting and giving me advises. Supervisor Certification

We certify that this thesis was prepared under our supervision at the Department of Computer Science / College of Science / Al-Nahrain University, by Kholood Jamal Moulod as partial fulfillment of the requirements for the degree of Master of Science in Computer Science.

List of Algorithms

- Algorithm 3.1 Framework of a Canonical GA.
- Algorithm 3.2 Compact Genetic Algorithm.
- Algorithm 4.1 Conceptual Framework for GA.
- Algorithm 4.2 Conceptual Framework for Cross-fertilizing GA with K-means.
- Algorithm 4.3 Conceptual Framework for Delivery of GA Results to K-means.
- Algorithm 4.4 Conceptual Framework for cGA.
- Algorithm 4.5 Conceptual Framework for Coupling cGA with K-menas.
- Algorithm 4.6 Conceptual Framework for Modified cGA.
- Algorithm 4.7 Conceptual Framework for Coupling Modified cGA with K-menas.

List of Denotations

GA	Genetic Algorithm.	
cGA	compact Genetic Algorithm.	
MRI	Magnetic reasoning image.	
AI	Artificial Intelligent.	
PSO	Particle Swarm Optimization.	
DCPSO	Dynamic Clustering Particle Swarm Optimization.	
NP	Non-deterministic Polynomial problem.	
EA	Evolutionary Algorithm.	
Γ	cGA chromosome decoding function,	
	$\Gamma: \{0,1\}^{8 * K} \to \{0,255\}^{K}.$	
δ	Positive scaling function.	
Φ_{cGA}	Fitness function of a cGA chromosome,	
	$\Phi_{cGA}: \{0, 255\}^K \to R.$	
Φ_{GA}	Fitness function of a GA chromosome,	
	$\Phi_{GA}: \{0,255\}^{l}GA \to R.$	
a, ab, b	cGA chromosome, $a, ab, b \in \{0,1\}^{l} cGA$.	
$\{S_1,,S_n\}$	Partition of image Z in K disjoint clusters $S_k \subset Z, k = 1,, K$.	
chrom	Canonical chromosome definition.	
chrom _i	i^{th} chromosome (individual) in the GA population,	
	$chrom_{i} = \{c_{i, i}\} = (c_{i, i}, c_{i, 2},, c_{i, i}).$	
\mathcal{C}_{k}	Centroid of cluster S_k , $k = 1,, K$.	
<i>C</i> _{<i>i,k</i>}	k^{th} cluster centroid of the i^{th} GA chromosome.	
d(x, y)	Distance between two pixel points.	
$d_{man}()$	Manhattan distance.	
$d_{eucl}()$	Euclidean distance.	

d _{max}	Intra-distance (compactness error).
d _{min}	Inter-distance (separation error).
8	GA or cGA generation number.
^g epoch	An epoch of GA generations.
^g max	Maximum number of GA generations.
ι	Termination criterion.
J _e	Quantization error.
K	Number of clusters in an image <i>I</i> .
l	Canonical chromosome length.
l _{cGA}	cGA chromosome length, $l_{cGA} = 8 * K$.
lGA	GA chromosome length, $l_{GA} = K$.
l_X	Length of chromosome segment.
m	Number of chromosome segments.
P_m	Mutation rate.
n	GA and cGA population size.
n_{\star}	Number of pixels in cluster $S_k, k = 1,, K$.
$N_{_{ m r}}$	Number of patterns i.e. pixel in image Z ,
	$N_{\mu} = ImageHeight * ImageWidth$.
р	l_{cGA} -dimensional probability vector, $p = [0,1.0]^l cGA$.
POP	GA population, $Pop = \{chrom_1,, chrom_n\}$.
P _C	Crossover rate.
<i>U()</i>	Uniformly distributed random number.
Т	GA population subset
w1	Priority of quantization error, $0 \le w_1 \le 1.0$.
w2	Priority of compactness error, $0 \le w_1 \le 1.0$.

w3	Priority of separation error, $0 \le w_1 \le 1.0$.
Ζ	Data set of grayscale image pixels $Z = \{z_1, z_2,, z_{Np}\}$.

Contents

Chapter 1: Overview

1.1 Data Clustering: Motivation and Challenges	
1.2 Evolutionary-based Clustering for Image Classification	4
1.3 Literature Survey	6
1.4 Work Objective	9
1.5 Thesis Organization	9

Chapter 2: Data Clustering: Mathematical Formulation

2.1 Introduction	10
2.2 General Terminologies	10
2.3 Clustering Algorithm	11
2.4 Partition and Centroid in Clustering	14
2.5 Distance Measurement	15
2.6 Clustering Validation Techniques	16
2.7 K-means Clustering	17
2.8 Unsupervised Image Classification	19

Chapter 3: Genetic Algorithm: Canonical and Compact Variants

3.1 Introduction	20
3.2 Canonical Genetic Algorithm	20
3.2.1 Individual Representation	21
3.2.2 fitness Evaluation	22
3.2.3 Selection Operator	23
3.2.4 Perturbation Operators	23
3.2.5 Conceptual Algorithm	26
3.3 Premature Convergence Problem	26
3.4 Real-coded GA	27
3.5 Compact Genetic Algorithm	31
3.5.1 Characteristic Components of cGA	31
3.5.2 Pseudo Code of cGA	33

Chapter 4: GA-based Clustering Algorithms

4.1 Introduction	34
4.2 Genetic Based Clustering Algorithms	34
4.2.1 Search Space Size and Problem Complexity	34

4.2.2 Individual Representation	35
4.2.3 Objective Functions: Fitness Evaluation	36
4.2.4 Selection Operator	36
4.2.5 Perturbation Operators	37
4.2.6 Stopping Criteria	38
4.2.7 Phenotype Representation: Genotype Decoding	38
4.2.8 Conceptual Algorithm	39
4.3 Coupling GA with K-means Algorithm	41
4.3.1 Delivery to K-means	43
4.3.2 Cross-fertilization with K-means	44
4.4 Compact Genetic Based Clustering Algorithms	
4.4.1 Population and Individual Representation	46
4.4.2 Initialization and Chromosome Generation	46
4.4.3 Fitness Evaluation	46
4.4.4 Update operator	47
4.4.5 Stopping Criteria	47
4.4.6 Phenotype Representation	48
4.4.7 Conceptual Algorithm	48
4.4.8 Coupling cGA with K-means	94
4.4.9 Modified cGA with Binary Perturbation Operators	50

Chapter 5: Experimental Results

5.1 Introduction	5٣
5.2 Experiment Parameters	5٣
5.3 Experimental Results and Evaluation	56

Chapter 6: Conclusions and Future Suggestions

6.1 Conclusions6.2 Future Suggestions	87 88
References	90

<u>in 27)</u>

العنقدة هي نظام خصص لإيجاد ووصف قطع متماسكة ومتجانسة في البيانات، هي العناقيد. مثال عن مسألة العنقدة هو الإظهار أو الكشف الأوتوماتيكي لأجزاء ذات معنى في الصورة الرقمية. الحث على التركيز على عنقدة البيانات بسبب إن عنقدة البيانات هي عملية مهمة في تمييز الأنماط و التعليم الالي. خوارزميات العنقدة تستخدم في عدة تطبيقات مثل تقطيع الصور، حساب متجه ولون الصورة، ضغط البيانات... الخ. لذلك، إيجاد خوارزمية عنقدة كفوءة هو شيء مهم جدا للباحثين في عدة أنظمة مختلفة.

الهدف الرئيسي لهذه الأطروحة هو استخدام الخوارزمية الجينية كأداة عنقدة للتصنيف غير الموجه للصورة ذات تدرج رمادي. هذه الأطروحة تقدم نوعين مختلفين من الخوارزمية الجينية: النوع الأول يعتمد على خوارزمية جينية بسيطة، بينما النوع الثاني يعتمد على الخوارزمية الجينية المصغوطة. المكونات الخصائصية لكل خوارزمية تعرض بصيغة تمثيل الفرد والمجموعة، حساب المضغوطة. المكونات الخصائصية لكل خوارزمية تعرض بصيغة تمثيل الفرد والمجموعة، حساب دالة المضغوطة. المكونات الخصائصية لكل خوارزمية تعرض بصيغة تمثيل الفرد والمجموعة، حساب المصغوطة. المكونات الخصائصية لكل خوارزمية تعرض بصيغة تمثيل الفرد والمجموعة، حساب دالة الملائمة، عمليات التطور (الانتقاء، التقاطع، والتحديث)، و شرط التوقف. هاتان الخوارزميتان الجينيتان سوف تربطان كل على حدة مع خوارزمية عنقدة بحث محلي تعرف ب(*Magorithm والجيني*). بالإضافة الى ذلك، الألية القانونية لعمليات التشويش التي يرمز لها بالتقاطع والطفرة المفاجئة تحاكي الموارزمية الجينية و قوة (*K*). الهدف من الربط هو تسخير قوة كل خوارزمية: قوة الخوارزمية الجينية و قوة (*K*). بالإضافة الى ذلك، الألية القانونية لعمليات التشويش التي يرمز لها بالتقاطع والطفرة المفاجئة تحاكي الموارزمية الجينية و قوة (*K*). الهدف من الربط هو تسخير قوة كل خوارزمية في الخوارزمية الخوارزمية الجينية و المفرة المفاخية الموارزمية التوابية المفاخية التوارزمية المفاخية المضغولية المفاخية المفاخية المفاخية المفاخية المفاخية المفاخين التوابية المفاخية الفاخين الذمان الخوارزمية المفاخية المفاخية المفغولة المفاخية المفاخية المفاخية المفاخية المفاخية المفاخية الفاخية المفاخية المفاخية المفاخية المفاخية المفاخية المفاخية الفاخية المفاخية الفاخية الفافية المفاخية الفاخية المفاخية المفاخية المفاخية المفاخية المفا

لعرض قابلية تطبيق خوارزميات العنقدة، تم استخدام صور أشعة رنين مغناطيسي لدماغ الإنسان، صور أقمار صناعية. أيضا تم استخدام أعداد عناقيد مختلفة في الاختبارات العملية. نتائج المقارنة سجلت بصيغة نوعية (مرئية) وصيغة كمية باستخدام (Quantization Error) والنسبة (Weighted Sum of cluster compactness, cluster separation, quantization error) بين (cluster compactness and cluster separation).

النتائج أظهرت أن (cross-fertilization) بين الخوارزميتين يعتبر فائدة في عنقدة الصورة، و يعمل بشكل أفضل من خوارزمية (*K-means*) و الخوارزميات الجينية عندما يعملان بشكل منفرد. بالإضافة إلى ذلك وهو الأكثر أهمية، الخوارزمية الجينية المضغوطة المحدثة تعمل بشكل أفضل من الخوارزمية الجينية المضغوطة العادية، لأنها زادت من قوة تأثير معاملات التشويش المضافة والتي تتضمن التقاطع ذو نقطتين و الطفرة الثنائية.
